Java Stream Basics, Java Stream
Methods

Learn to **count the matching items in the Stream that are passed by a specified filter expression**. To count the items, we can use the following two methods and **both are terminal operations and will give the same result**.

- `Stream.count()`
- `Stream.collect(Collectors.counting())`

Table Of Contents

[1. Stream count\(\) API](#)

[2. Counting Matches in Stream](#)

[Example 1: Counting all items in the Stream](#)

[Example 2: Counting items matching to Stream filter\(\)](#)

1. Stream count() API

The `Stream` interface has a [default method](#) called `count()` that returns a `long` value indicating the number of matching items in the stream.

```
long count()
```

To use the `count()` method, call it on any *Stream* instance.

```
Stream s = ...;  
  
s.count();  
//or  
s.collect(Collectors.counting());
```

2. Counting Matches in Stream

Example 1: Counting all items in the Stream

In this example, we are counting the number of elements in different kinds of streams such as `IntStream`, `LongStream`.

```
long count = Stream.of("how", "to", "do", "in", "java").count();    //5  
  
long count = IntStream.of(1,2,3,4,5,6,7,8,9).count();    //9
```

Example 2: Counting items matching to Stream filter()

To count the matching items, we need to apply a filter expression or predicate to filter that will find the matching items and then we can use `count()` API to count the items.

In the given example, we are counting all the even numbers in the stream.

```
long count = LongStream.of(1,2,3,4,5,6,7,8,9)  
    .filter(i -> i%2 == 0)  
    .count();  
//or  
//.collect(Collectors.counting())
```

Happy Learning !!
